

Jesus across the corpora in this project, chapter by chapter

Each ridge is the distribution, across a corpus's chapters, of the percent of text units referring to Jesus Christ, ordered by the mean chapter. One coding rule applied to every corpus. Corpora with at least 6 chapters of 5 or more verses; the Bible split into its testaments and shown as the King James Version, the Qur'an as Yusuf Ali.

Ridges piled at zero are corpora in which Jesus essentially never appears; the mass is at zero, not spread.
The figure at the right of each ridge is that canon's overall rate. Coding rule and validation: docs/CODEBOOK.md and README, section 9.
